Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Introduction

Quadmap Project has met the challenge of defining a **methodology to select, analyse and manage Quiet Urban Areas (QUAs)** which has been tested in **10 Pilot Areas** located in Florence (6 school yards), Bilbao (a square and a green corridor) and Rotterdam (2 public parks).

The methodology is thoroughly illustrated in the **Guidelines** which can be considered one of the Project's main final result.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Guidelines were drawn up to:

- help policymakers, competent authorities and any other stakeholders to understand the END's requirements pertaining to QUAs
- propose a complete and tested methodology in order to fulfill the END requirements, to deliver indicators for selecting, analysing and managing QUAs and also propose specific tools offering a high degree of flexibility in their application
- help to answer some research questions posed in the Good practice guide on quiet areas, published by the EEA in 2014, in particular the need to combine users' acoustic and overall perception of a QUA.

Rotterdam 19-20 February 2015

LIFE10 ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Summary

- QUAs definition
- Methodology addressed to QUAs
 - QUAs pre-selection: description and tools
 - QUAs analysis (non-acoustic evaluations by experts, noise measurements and end-users questionnaires): description, tools and examples
 - QUAs management: description and tools
- Conclusions

Rotterdam 19-20 February 2015

LIFE10 ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

QUA definition

The methodology proposed by the QUADMAP Project is based on a new definition of QUA.

END definition:

“quiet area in an agglomeration” shall mean an area, delimited by the competent authority, for instance, which is not exposed to a value of L_{den} or of another appropriate noise indicator greater than a certain value set by the Member State, from any noise source.

QUADMAP definition:

a QUA is an urban area whose current or future use and function require a specific acoustic environment, which contributes to the well-being of the population.

According to the QUADMAP definition, the final objective when providing QUAs is to define areas where people can **find some refuge from urban environmental stress factors** and where the well-being is improved, regardless of the current acoustical and general climate of the area.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Methodology addressed to QUA

The methodology illustrated in the guidelines is essentially organised into three main phases: the **pre-selection of potential QUAs**, the **analysis used to designate them as QUAs** and their **management**.

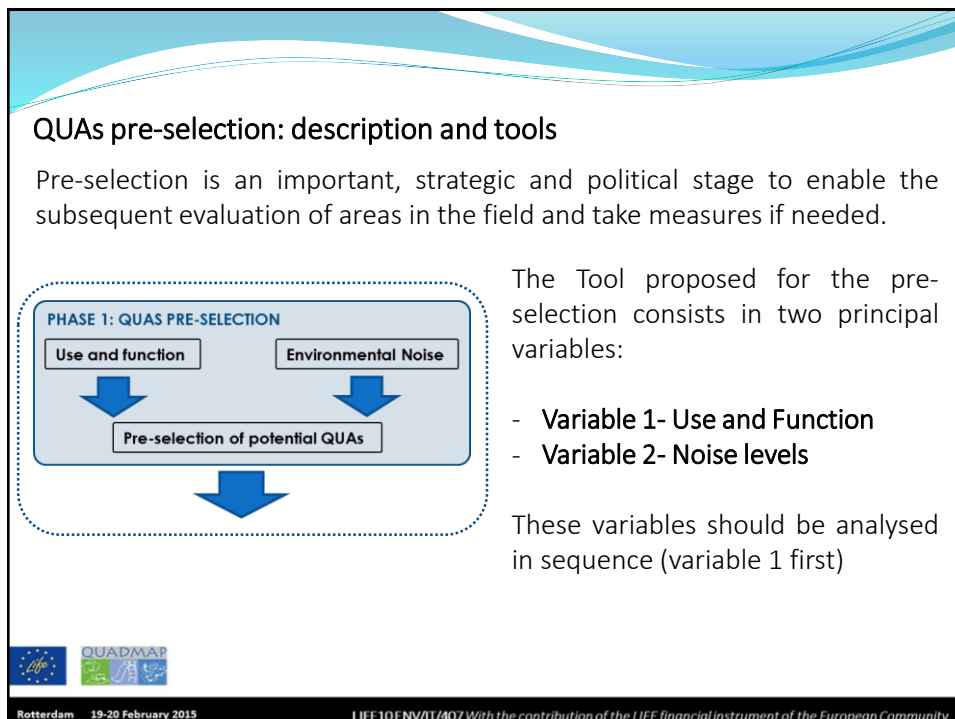

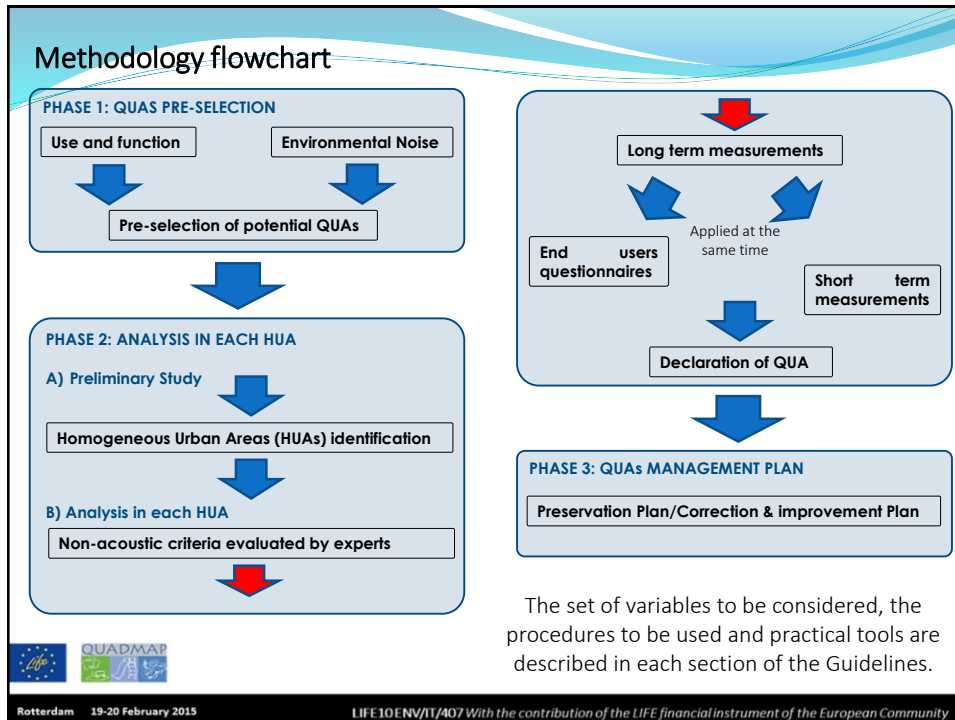

The proposed methodology is based on crossing information from four main sources of information:

- Environmental noise maps;
- Expert analysis;
- User perception;
- Sound measurements.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Indicators for describing the two principle variables and the methods for their use are also introduced.

Variable 1-Use and Function

Criteria:

- **Category of land use in general urban planning:** residential, parks, gardens and forests, commercial areas, school areas, historic center, cultural areas, etc.;
- **The area's (current) function:** social relationships, conversation, resting, reading, playground, sport activities, leisure activities, etc.

Method of Analysis:

- Category of land use in general urban planning: **official urban planning documents;**
- Current or future function of the area: **interview with and/or observation of key experts and municipality technical staff.**

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Variable 2-Noise Levels

Criteria:

- Yearly averaged **Lden values** related to noise emitted by road, rail, and air traffic, and industrial sites.

Method of Analysis:

- **Comparison of Noise Maps** (provided by the END's requirements or national legislation) **with the threshold defined below.**

Threshold value:

- **Lden < 55 dB or another value defined by national legislation**, depending on the use and function of the area.

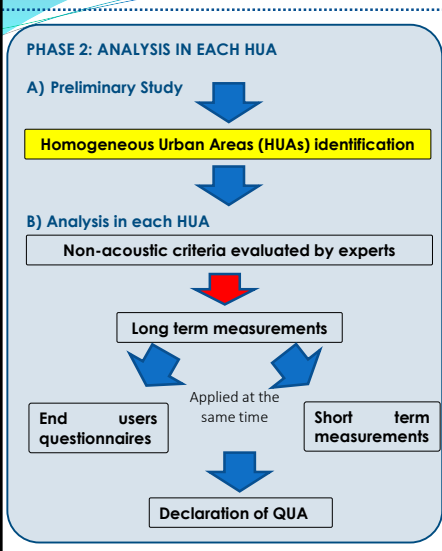

As well as the variables 1 and 2, complementary variables and approaches can also be employed to pre-selection QUAs (Fair access, public opinion, public use) according to the Guidelines.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

QUAs analysis: description, tools and examples

HUAs should be delimited according to one or more of the following criteria:

Criterion 1-Landscape: uniform visual elements and landmarks.

Criterion 2 - Use: one main and specific use or function. This is related to the facilities and furniture in the area.

Criterion 3 - Presence of and distance from sound sources

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

HUAs subdivision-example from the application of the Tool in a pilot case located in Florence

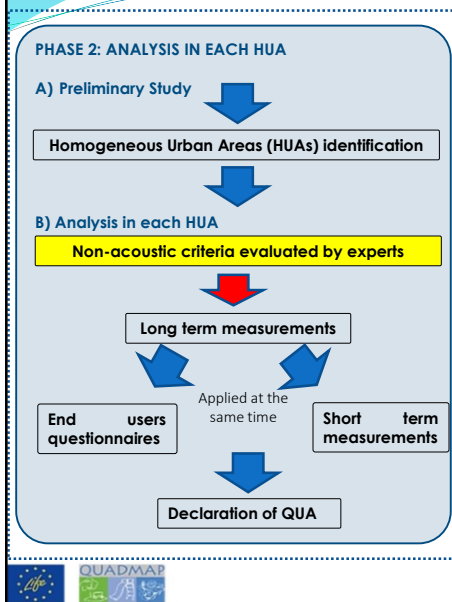

Montessori-Vamba schoolyard, plan of the area	Description of the pilot area
	<p>The "Montessori-Vamba" school complex is located in Giardini della Bizzarria Street, Florence (ITALY). The schoolyard designated as a QUA as part of the QUADMAP Project is attended by pupils from the nursery school.</p> <p>It is mainly affected by road noise from Torre degli Agli Street and Giardini della Bizzarria Street.</p> <p>Around 460 people use this schoolyard.</p>
	<p>Using the tool</p> <ul style="list-style-type: none"> •Landscape: The potential HUAs both feature similar visual elements and landmarks; •Use: The potential HUAs are both in the school grounds but the users are different. Each class is assigned part of garden for recreation time. •Presence of and distance from sound sources: HUA "A" is affected by road traffic noise from Giardini della Bizzarria Street and Torre degli Agli Street; HUA "B" is only affected by road traffic noise from Torre degli Agli Street.
	<p>The presence of two sub-areas is, therefore, confirmed due to their use by different groups and the distance from sound sources.</p>

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Non-acoustic evaluations by experts

This Tool is implemented in order to collect some non-acoustic factors that might be required for an area to be considered in the assessment of the quality of QUAs.

Criteria to be evaluated by experts are:

CRITERIA	
Principal non-acoustic criteria	
Landscape	
Natural elements	
Cleanliness and maintenance	
Safety	
General criteria	
Urban environment	
Proximity to residential areas	
Accessibility	
Proximity to noise sources	
Presence of a multi-source scenario	
Measures to reduce noise	
Behavioural criteria	
Number of users	
Distribution of users (geographical)	
Activities performed	

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Criteria, methods of analysis and ratings

Variables for general analysis

CRITERIA	DESCRIPTION	PARAMETERS	RATING	POSSIBLE SOLUTIONS
Urban environment	Location of the area with respect to key social points in the city (e.g. library, church, etc.)	Far from key points	Red square	No immediate solution
		No key points	Yellow square	
		Close to key points	Green square	
Proximity to residential areas	Proximity to residential area increases the number of users of the area	More than 5 km	Red square	No immediate solution
		Between 500 m and 5 km	Yellow square	
		Less than 500 m	Green square	
Accessibility	Accessibility (also considering people with reduced mobility) by public transport or by cycle paths and/or footpaths	No public transport, no cycle path, no footpath	Red square	Create cycle and footpaths, develop public transport, add bus stops or lines, create reduced speed zone.
		Two of the following: public transport, cycle path, footpath	Yellow square	
		Public transport and cycle path and footpath	Green square	
Proximity to noise sources	Proximity to noise sources means possible high noise levels. If users can also see the source of noise, this psychologically affects their perception of the noise	Main noise source is close to the HUA and it is visible by users, potentially audible	Red square	The choice of solutions should consider measures that hide or mask the sources.
		Main noise source is close to the HUA and it is not visible by users, potentially non-audible	Yellow square	
		Main noise source is far from the HUA, potentially audible	Green square	
Multi-source scenario	Presence of multiple noise sources of one or more kinds (road, rail, air traffic, industrial activities)	3 or more sources	Red square	Assess contribution of every kind of noise source and study solutions also evaluating combined effects for all main sources.
		2 sources	Yellow square	
		1 source	Green square	
Measures to reduce noise	Noise reduction measures carried out	Measures with good acoustic efficacy are needed but not possible	Red square	Propose possible integration of current measure to improve acoustic efficacy. The choice of solutions should be made taking into account the results of end-user questionnaires
		Measures with average acoustic efficacy are needed and possible, but not present	Yellow square	
		No measures are needed	Green square	

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Non acoustic analysis carried out by experts-example from the application of the Tool in a pilot case located in Florence

Dionisi schoolyard, plan of the area

Description of the pilot area

"Dionisi" nursery school is located in Aretina Street, Florence (ITALY). It is mainly affected by road noise from Aretina Street. Around 54 people use this schoolyard.

Using the tool

The experts nominated to evaluate non-acoustic criteria were the

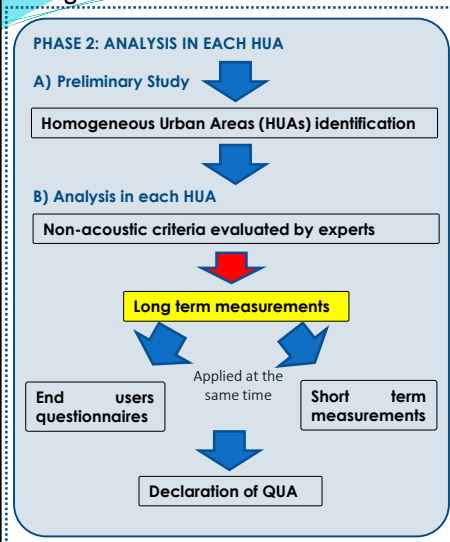

CRITERIA	DESCRIPTION	PARAMETERS	RATING	4	POSSIBLE SOLUTIONS
Landscape	Greenery, water, or specific view (architecture, etc.) visible from the area	None Only in 1 direction (N, S, E, W) 3-4 directions (N, S, E, W)	■ ■ ■	■	
Cleanliness and maintenance	Evaluation of cleanliness through observation by experts	Not maintained (uncut grass, broken benches, etc.) and untidy (rubbish on the ground and/or not in the bin, etc.) Regularly maintained Regularly maintained and clean	■ ■ ■	■	Recommend measures to improve cleanliness.
Safety	Evaluation of safety through observation by experts	Dangerous area (official statistics from the area show robberies, attacks and accidents in the area) Un-guarded spaces or dark zones with poor lighting Guarded and well-lit spaces	■ ■ ■	■	Recommend interventions to improve safety 04: FENCE-OFF THE GARDEN

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Long term measurements

Long-term measurements should be carried out in each QUA to achieve the following aims:

- 1) To **detail the noise maps**, in the specific studied areas.
- 2) To **collect acoustic information about the variability of sound levels** over time in the area and to decide and justify the representativeness of the acoustic environment in the periods when the deeper analysis is made. In this sense, long-term measurements can be used to establish which are the most representative periods for carrying out "in situ" surveys (end-user questionnaires and short-term measurements).
- 3) To **assess the impact of the acoustical interventions**. This means, to compare results before and after the interventions.

Long term measurements-example from the application of the Tool in a pilot case located in Florence

Dionisi schoolyard, plan of the area

Description of the pilot area

"Dionisi" nursery school is located in Aretina Street, Florence (ITALY). It is mainly affected by road noise from Aretina Street. Around 54 people use this schoolyard.

Using the tool

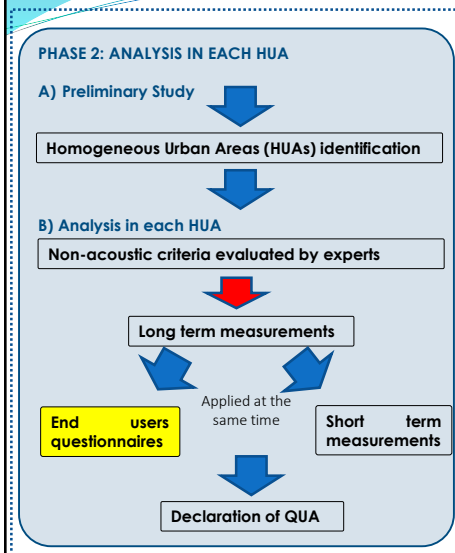

In this case, surveys were carried out between 2 p.m. and 4 p.m., although other time slots could also be considered equivalent. Compared with the noise levels in the noise map produced according to directive 2002/49/EC, the long-term measurements produced very interesting results, because in some pilot cases, such as the Dionisi school, they demonstrated the poor accuracy of noise maps due to overestimated road traffic in the streets close to this school.

End-users questionnaires

An "in situ" analysis is carried out in each area during the times of day that are most representative in terms of when people visit the area (chosen based on long-term measurement analysis). This Tool describes the questionnaire's structure and deployment strategy.

The surveys are conducted at the same time as the short-term measurements and they are grouped within 30 min. periods.

TOOL 4: QUESTIONNAIRE

GENERAL

- Organize at least one survey in each of the most representative urban areas in each city.
- Organize at least one survey in each of the most representative urban areas in each city.
- The survey should be carried out in the most representative urban areas in each city.
- The survey should be carried out in the most representative urban areas in each city.

INTERVIEW

- Interviewers must be trained in the use of the questionnaire.
- Interviewers must be trained in the use of the questionnaire.
- Interviewers must be trained in the use of the questionnaire.
- Interviewers must be trained in the use of the questionnaire.

QUESTIONNAIRE QUESTIONS

Questionnaire (urban) areas

Interviewer: _____ **Phone:** _____

Number of participants: _____ (to be filled in by interviewer)

Name of area: _____ (to be filled in by interviewer)

Location: _____ (to be filled in by interviewer)

Date: _____ (to be filled in by interviewer)

Starting Time: _____ **Ending Time:** _____

End users questionnaire-example from the application of the Tool in a pilot case located in Bilbao

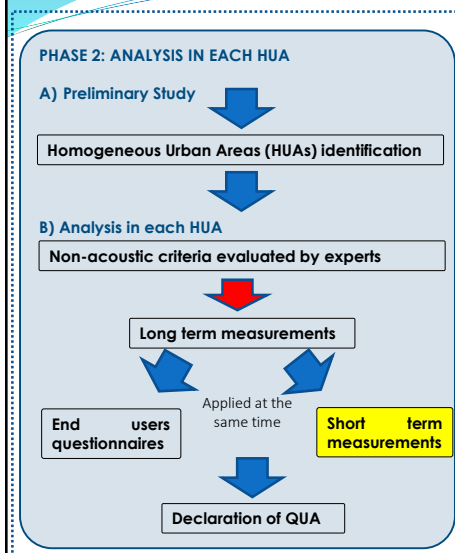

General La Torre square, plan of the area	Description of the pilot area							
	<p>Mainly use for resting, social interaction, reading and relaxing (benches fully occupied) and going through. Mainly use by elder people > 50 years old. It was in the middle of a redevelopment during the Project. Consequently, this Tool was used twice – before and after interventions – to analyse the improvement in the acoustic environment in an area that underwent changes aimed at reducing noise and increasing tranquillity.</p>							
	<p>Using the tool</p> <p>The sample was big enough to be representative: 80 people, 38 (47.75 %) in the morning and 41 (51.25 %) in the evening. There was a good gender split (43.75 % male, 56.25 % female) and the respondents were mainly from Bilbao and from the neighbourhood where the square is located (87.5 % Bilbao residents and 51 % local residents).</p> <p>Activity of users:</p> <ul style="list-style-type: none"> - Good overall satisfaction with the place: <table border="1"> <thead> <tr> <th>BEFORE INTERVENTIONS</th> <th>AFTER INTERVENTIONS</th> </tr> </thead> <tbody> <tr> <td>22.8 %</td> <td>97.5 %</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>WAITING FOR SOMEONE (AM / PM)</th> <th>WAITING FOR SOMEONE (AM / PM)</th> </tr> </thead> <tbody> <tr> <td>Waiting for someone (8.0%).</td> <td>Waiting for someone (22.2%)</td> </tr> </tbody> </table>	BEFORE INTERVENTIONS	AFTER INTERVENTIONS	22.8 %	97.5 %	WAITING FOR SOMEONE (AM / PM)	WAITING FOR SOMEONE (AM / PM)	Waiting for someone (8.0%).

Waiting for someone (8.0%).	Waiting for someone (22.2%)							

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Short term measurements

The purpose of short-term measurements is to **collect acoustic information about the present sound levels during the in situ analysis**. They are carried out in each area at the time of day that is most representative (chosen on the basis of long-term measurement analysis) in terms of when the public visits the area and at the same time as the questionnaires.

The evaluation is made in **30 minutes**, since this is the average length of time people remain in the areas in which an interview takes place. This way, the acoustic parameters are strictly linked to the groups of interviews.

Short term measurements-example from the application of the Tool in a pilot case located in Bilbao

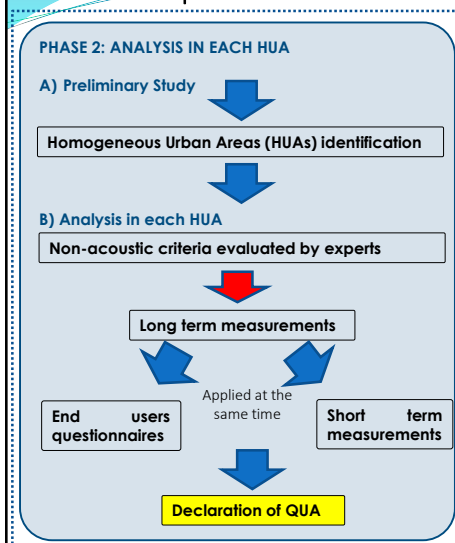

General La Torre square, plan of the area	Description of the pilot area																							
	Mainly use for resting, social interaction, reading and relaxing (benches fully occupied) and going through. Mainly use by elder people > 50 years old.																							
	<p>Using the tool</p> <p>1 second short measurements were carried out in a point located in the center of the area and information on different noise indicators were collected. The data from the short measurement is linked to the results of the questionnaires to analyse the possible acoustic causes of certain answers.</p> <p>The information collected was summarised and processed to obtain data from a time of day that was representative of when the area was in use.</p>																							
	<table><tr><th rowspan="2">POST-INTERVENTIONS</th><th colspan="2">Morning</th><th colspan="2">Evening</th></tr><tr><th>11:00-11:30</th><th>11:30-12:00</th><th>18:00-18:30</th><th>18:30-19:00</th></tr><tr><td>L_{Aeq}</td><td>64 dBA (-3)</td><td>66 dBA (+4)</td><td>64 dBA (0)</td><td>66 dBA (+4)</td></tr><tr><td>Negative events</td><td>2 (-4)</td><td>2 (-4)</td><td>2 (-7)</td><td>0 (-2)</td></tr><tr><td>Positive events</td><td>0</td><td>0</td><td>0</td><td>4 (+4)</td></tr></table> <p>The information in brackets is the difference between the results after and before the interventions.</p>	POST-INTERVENTIONS	Morning		Evening		11:00-11:30	11:30-12:00	18:00-18:30	18:30-19:00	L _{Aeq}	64 dBA (-3)	66 dBA (+4)	64 dBA (0)	66 dBA (+4)	Negative events	2 (-4)	2 (-4)	2 (-7)	0 (-2)	Positive events	0	0	0

Positive events	0	0	0	4 (+4)																				

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Evaluation of quietness

Finally, the following method is suggested for evaluating the results of the analysis phase:

- If a criterion is present in only one analysis (e.g. in the expert analysis) and has a negative rating (e.g. red colour) the area is defined as only potentially quiet;
- If a criterion is present in more than one analysis (e.g. in both the expert analysis and the end-user questionnaire) and has a negative rating (red colour) in the expert analysis, the corresponding score assigned by end-users should be checked; if the evaluation given by end-users is also negative (e.g. average score ≤ 3) the area is defined as only potentially quiet.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

QUAs management: description and tools

Different management goals can be defined depending on whether the selected areas were defined as actually quiet or only potentially quiet during the analysis phase:

- A plan to preserve the quality of the area if it is defined as already quiet.
- A plan to increase the value of the area and to promote its use.
- A plan to improve the quality of the area if it can only be defined as potentially quiet, and planning of the type of measures to be implemented.

Actions for the QUA preservation and promotion have been detailed in the guidelines (...).

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

In the last case, the following procedure is proposed for defining and designing interventions:

- Any intervention should aim to **solve all critical situations identified during the analysis phase**;
- **Intervention should be inspired by the suggestions obtained from the expert analysis and/or end-user questionnaire results.**

Moreover, according to the analysis carried out in the QUADMAP Project, the suggested criteria for **evaluating the effectiveness of noise abatement measures** in a quiet urban area are as follows:

- The **reduction of noise levels** (mainly concerning the LA50/LAeq indicators) **compared to a threshold level** (e.g. 55 dB);
- The **reduction of noise levels** (mainly concerning the LA50/LAeq indicators) **compared with the noise levels before the interventions**; a **reduction of unpleasant noise events and/or an increase in pleasant events**.
- An **improvement in end-users' perception** (evaluated through the end-user questionnaire) compared with the users' perception before the interventions.

Meeting at least one of the above criteria can be considered as an improvement to the area's acoustic environment.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Conclusions 1/2

EU Directive 49/2002/EC on Environmental Noise defines a Quiet Urban Area (QUA) as “an area, delimited by the competent authority, for instance which is not exposed to a value of L_{den} or of another appropriate noise indicator greater than a certain value set by the Member State, from any noise source”. This definition is extremely vague and does not provide usable procedures to be applied in each country.

Proposing a solution to overcome the lack of harmonised methodologies for QUAs is the main aim of the QUADMAP (QUIet Areas Definition and Management in Action Plans) Project.

In fact, the QUADMAP Project has developed a procedure for selecting, analysing and managing QUAs that has been tested in ten pilot areas and that, consequently, has proved to be valid. In addition, thanks to its flexibility, the methodology is also easily replicable in other urban environments.

Rotterdam 19-20 February 2015

LIFE10ENV/IT/407 With the contribution of the LIFE financial instrument of the European Community

Conclusions 2/2

One of the most innovative aspects of the methodology developed by QUADMAP Project is the **involvement of the public in planning and designing noise abatement intervention (Participatory approach)**. In fact, interviews should always be carried out in order to ask for users' opinion about the typical aspects of each QUA and to obtain suggestions for the type of intervention to be implemented.

Using the proposed methodology as a starting point, comprehensive guidelines have been produced.

The first aim of the guidelines is to help stakeholders, competent authorities and interested parties to understand the END's requirements with respect to QUAs and to suggest a valid and easily applicable methodology in order to meet them. In addition, these guidelines also suggest possible answers to some research questions posed in the Good practice guide on quiet areas, published by EEA in 2014, in particular the need to combine users' acoustic perception of a QUA with their general opinion of the area.
